

Tick Mike's Education Corner

Ticks: Ticks come from many host animals such as raccoons, squirrels, rabbits and birds just to name a few. If your yard has never been treated for ticks or mosquitoes we recommend that you spray twice the first month and monthly thereafter.

If you have pets you may find that they like to wander further into the woods than you have sprayed and they may bring some ticks back with them. This does not mean that our product failed but that your pet went past the border of where you sprayed.

Ticks like to hide under leaves and in wood piles. Before spraying make sure to remove your leaves and debris to get the best possible effect of our product.

Remember, even if you protect your property your neighbors may not protect theirs. The wind can also bring in ticks via the leaves that blow. Many a tick has survived by hiding under leaves even blowing leaves.

Mosquitoes: When spraying for mosquitoes be sure to remove any standing water on your property as this is where egg laying occurs. Check in bird baths, tree stumps, unused toys, and old tires are good places where standing water can be. Even a small bottle cap can hold water enough for egg laying. Areas that may flood are mosquito breeding grounds. Let's target the adult mosquito so there will be no babies. Spraying up into the trees under the leaves is where adult mosquitoes hide during the day. Also, under shrubs and anywhere it is shaded and moist. Knowing your enemy is how to overcome them.

We have done our part by creating a product for homeowners that works when used as directed. When you do your part we will be working together to eliminate ticks and mosquitoes and the hazards they can produce.

Disclaimer: Damn Pests LLC, maker of Tick Mike's Tick & Mosquito Hose Spray is not responsible for any past, present, or future tick or mosquito born disease that you, your family or pet(s) may encounter. This product was created to significantly reduce tick and mosquito populations. Use of this product is of your own free will.
